

Database Design

Schedule Database Downloading x 5 Sources

Data Collation of 5 Data Sources

Data De-Duplication

Design Front-End of Database

Document Everything

1. Introduction

The purpose of the project is to build a database from four data sources, design the database, and build a front-end and back end of the database system for users to access.

The software system that we wish to design aims to ingest bulk data from OpenSanctions.org and OpenOwnership.org, and make it accessible to users through a WordPress-based front-end.

2. Tasks Required for Completion

The primary tasks that you are required to complete are as follows:

1. Review the Open Sanctions website for the bulk JSON / TXT data:
 - <https://www.opensanctions.org/datasets/default/>
2. Review the Open Ownership website for the bulk JSON / TXT data:
 - <https://bods-data.openownership.org/source/register/> (this is their bulk dataset but it doesn't include Latvia or GLEIF data which is below)
 - <https://bods-data.openownership.org/source/latvia/> (missing in their bulk data)
 - <https://bods-data.openownership.org/source/gleif/> (missing in their bulk data)
3. Understand how the datasets from Open Sanctions and Open Ownership work together on the opensanctions.org platform. (They say they use the "Follow the Money" format – google this or read more at opensanctions or here <https://docs.aleph.occrp.org/developers/followthemoney/>).

<https://www.openownership.org/en/news/connecting-beneficial-ownership-peps-and-sanctions-data-with-openscreening/>

<https://www.linkedin.com/pulse/spotting-risks-combining-beneficial-ownership-public-procurement/>

4. Design and document an appropriate database schema to re-combine OpenSanctions and OpenOwnership into a single database format which can be queried easily and which can connect reconcile that certain data may be related.
 - a. You should look at the FOLLOW THE MONEY database schema because that's the scheme used by OpenSanctions now.
 - b. The database should always indicate the source of each data record – i.e. what was the ultimate source of data (not Open Sanctions or OpenOwnership – but who they their record from – this is extremely important when designing the database).
 - c. Example – the name of a sanctioned person could appear in both Open Sanctions and Open Corporates. Do we link them in the database or do we link them at the query level – i.e. when searching for those individuals? You will need to decide this and document your decision.
 - d. The overall database structure must be documented fully.
 - e. Each table and column should be documented.
 - f. Provide the RDF / install it on the server so we can look at this graphically. E.g. <https://service.tib.eu/webvowl/#iri=https://alephdata.github.io/followthemoney/ns/ftm.xml>
5. Select an appropriate database (**which is compatible with WordPress**) – ensuring that the database is robust, capable of handling 10-20 million records, and supporting approximately 100 queries per minute.
6. Write a script which will regularly download all of the data from Open Sanctions bulk dataset (1) and the Open Ownership bulk datasets (3) and insert it into our database.
 - a. Script should de-duplicate data – i.e. if it already exists in the table then it shouldn't re-add it.
 - b. If the data is different from the database table than source (i.e. some names have been removed) then our source should stay the same but addend that it was removed from the original data set
7. Suggest the cron job settings which will trigger the script to download data from OpenSanctions. Include any permissions required for the script to operate.
8. Addressing data versioning and mismatch handling, ensuring that new data additions do not overwrite old data.
9. Install the database on our server and configure all bulk downloaders / scrapers and other tools.
10. Document all database configuration, usernames, passwords etc.
11. Write a web-interface to search the datasets and yield the results of the data (see screenshots herein). The web interface should be a plug in for WORDPRESS. It can call the remote database directly on another server if necessary.

3. Methodology

To achieve the above objectives, the following methodology is proposed:

3.1 Learn About Follow the Money Database Format

1. Understand how Follow the Money format works. This will be crucial as Open Sanctions bulk dataset is in Follow the Money.

3.2 Database Selection

2. Evaluate various database options compatible with WordPress, such as MySQL or MariaDB, and select the most suitable one based on scalability, performance, and ease of integration with WordPress.
3. Justify the selection by providing reasons for choosing the chosen database system.

3.2 Database Schema Design:

1. Create a comprehensive database schema that accommodates the types of data provided by OpenSanctions and Open Ownership (probably Follow the Money format)
2. Include fields for data source annotations, versioning, and unique identifiers.
3. Define relationships between tables as needed for data integrity.
4. Define relationships between records and ultimate data sources.

3.3 Crawler and Cron Job Implementation:

1. Locate Bulk Datasets from Open Sanctions and Open Ownership that need to be downloaded and updated regularly.
 - <https://www.opensanctions.org/datasets/default/>
 - <https://bods-data.openownership.org/source/register/> (this is their bulk dataset but it doesn't include Latvia or GLEIF data which is below)
 - <https://bods-data.openownership.org/source/latvia/> (missing in their bulk data)
 - <https://bods-data.openownership.org/source/gleif/> (missing in their bulk data)
2. Develop a crawler that can daily go and check the current data against the existing data
3. Define the exact list of software and cron jobs required to automate data downloading, annotation, de-duplication, and storage.
4. Develop the necessary software code for each cron job, ensuring error handling and reliability.

3.4 Develop the User Interface

1. Develop the user interface (as a plugin for wordpress) – see screens herein.

3.4 Robustness and Performance:

2. Implement data archiving mechanisms to maintain historical records.
3. Develop a strategy for handling data versioning and mismatches, ensuring that new data does not overwrite old data but appends to it.
4. Perform stress testing to ensure the database can handle the expected load, i.e., 10-20 million records and 100 queries per minute.

3.5 Documentation:

1. Provide well-documented software / scripts and for cron jobs.
2. Provide well documented source code for the Wordpress Plugin.
3. Document usernames and passwords required for data access and maintenance.

4. Outputs

Upon completion of this phase, the following outputs are expected:

1. A well-defined database schema that aligns with the project's objectives.
2. A justification for the selected database system.
3. Functional and well-documented plugin, software code, script(s) and cron job(s).
4. Thorough testing of the plugin, database schema, data collection and other scripts, and cron job(s).
5. Well documented source code.
6. Installation guide
7. A document containing all necessary usernames and passwords for maintenance and access.

5. Front End Screens for Wordpress Plugin

- We have the Figma file for these designs
- No need to design the headers / footers – they will be part of wordpress main frame

6. Back End Screens for Wordpress Plugin

- We have the Figma file for these designs
- No need to design the headers / footers – they will be part of wordpress main frame

6.1. Connect Plug in to Database

Database might be on a different server

The screenshot displays a web application interface divided into three main sections:

- System Information:** A table listing various system parameters.
- Database Connection:** Fields for server address, username, name, and password, along with connection status and action buttons.
- Sync & Update:** A section for synchronizing data, featuring a progress bar and confirmation message.

Title	Value
WP version	6.2.2
WP language	en_US
WP memory limit	128 MB
Plugin Version	1.0
Server info	Apache
MySQL version	5.7.39-42-log
PHP version	7.4.33
PHP post max size	256M
PHP execution time limit	120 - Recommended max_execution_time: 180 (or more)
PHP max input vars	3000
PHP safe mode	-
PHP memory limit	768M
PHP max upload file size	256M

Database connection details:

- Database server address *: 192.168.21.128 ✓
- Database username *: admin! ✓
- Database name *: example_search! ✓
- Database password *: !@371!24!!@#&! ✓

Status: Successful connection !

Database connection actions:

- Connect Database ↻
- Disconnect Database ⊗

Sync & Update:

Synchronize data quickly with real-time by clicking this button [Sync ↻]

5001841 data being updated

[Progress Bar: 23%]

Congratulations ! All data has been synced !
